

ELIMINATING SINGLE-USE PLASTIC WIPES.

SHOT is a new sporicidal surface disinfectant brought to you by Tristel. One SHOT Capsule generates 500ml chlorine dioxide working solution for use on high-touch, non-invasive medical device surfaces. SHOT uncouples the liquid from the spreader, enabling you to decide how much you use and how you disperse it, whether that be with a paper towel, microfibre mit or a biodegradable dry wipe.

One diluted SHOT Capsule can disinfect an entire patient bed space compared to many pre-saturated plastic wipes. When applying SHOT solution onto a surface, the same spreader can be re-wetted to continue disinfecting. A single-use wipe from a tub or pack cannot be re-used; it is used once and then thrown away, just like a plastic straw or cup would.

The SHOT Bottle and Doser are made of 100% reusable and recyclable polypropylene, and the Capsule is 100% recyclable. Tristel have also developed the SHOT Bot, a compact recycling container for empty Capsules which are ground into pieces for the creation of new Capsules.
